Art Unit: 2664

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

2. Claims 1, 5-9, 13-14, and 17 are rejected under 35 U.S.C. 103(a) as being unpatentable over U.S. Pat. No. 5,515,376 issued to Murthy et al ('376).

Considering claim 1, '376 teaches: a plurality of receiving devices corresponding to ports on the multiport switch (see, e.g., print figure 1 and its description); each of the receive devices configured to receive data frames and transmit the data frames on an internal bus to an external memory interface (see, e.g., figure 6 and its description); a plurality of queues corresponding to ports on the multiport switch, the plurality of queues formed on a memory device that includes a write port and a read port to enable data to be written to and read from the memory device wherein each of the plurality of queues is configured to store frame header information received via the write port (see, e.g., figures 10a-b and related description, see also col. 10, lines 32-35); a scheduler ('376's time slots are allocated and that performing apparatus appears to be a

Art Unit: 2664

“scheduler”); a decision making engine, See e.g., Figure 6 item 43. To the extent that ‘376 does not teach does not teach writing and reading from memory simultaneously it would have within the level of skill and obvious to the ordinary artisan of 5/21/99 for the benefit of a faster (and more efficiently operating) switch.

Considering claim 5, see ‘376's figure 2 and its description.

considering claim 6, headers in virtually local area network's always or almost always contain related information.

Considering claim 7, see col 10 at lines 30-35.

Considering claim 8, see the rejection to claim 1 above. In addition see col. 18 at lines 48-59, col. 13 at lines 36-42.

Considering claim 9, priority consideration was well known to the instant ordinary artisan of May 21, 1999 and used to better assure that time sensitive transmissions are less interrupted (e.g., video). Further, it appears that headers are always or almost always in predetermined time slots. See ‘376, e.g., figure 2.

Considering claim 13, see the rejection to claim 6 above

Considering claim 14, see the rejection to claim 8 above.

Considering claim 17, see ‘376 figure 2.

3. Claims 2-4, 10-12, and 15-16 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.
